Novel isolated nucleic acid fragment encoding soybean myo-inositol 1-phosphate synthase, useful for altering raffinose saccharide, sucrose, phytic acid and inorganic phosphate content of soybean seeds. NO 10; 34pp; English

The invention relates to an isolated nucleic acid fragment encoding a coybean myo-inositol 1-phosphate synthase, or a mutant myo-inositol 1-phosphate synthase. Also included are a chimeric gene (comprising the nucleic acid encoding soybean myo-inositol 1-phosphate synthase, its complement, subfragment or the complement of the subfragment, operably CC linked to suitable regulatory sequences, where expression or native gene encoding a soybean myo-inositol 1-phosphate synthase, its comprising the chimeric gene (with a heritable phenotype of a seed phytic acid content of less than 17 micromol/g, a seed content of raffinose plus stachyose of less than 17 micromol/g, as eed sucrose content of cromprising treater than 200 micromol/g, provided that the plant is not LR33), seeds from the plant, making a soybean plant with the heritable phenotype (comprising treater) that are plant comprising the chimeric gene with an elite soybean plant and selecting a progeny plant of the cross of crossing step that has a heritable phenotype as mentioned above), seeds of soybean plant made by the above method, a soy protein product derived from seeds of a soybean plant (homozygous for one or more gene encoding a soybean product derived from seeds of a soybean plant with the plant of sepacity for the synthesis of myo-inositol 1-phosphate synthase having decreased capacity for the synthesis of myo-inositol 1-phosphate, where the gene confers a content of soybean product derived from seeds of a soybean plant with heritable phenotype as mentioned above, and making or producing a soybean product derived from seeds of a soybean plant with heritable phenotype as mentioned above. The nucleic acid is useful for constitution of soybean products, since the presence of high concentration of raffinose oligosacharides in soy plants (and other legumes) can lead to flatulence when consumed by humans. The present sequence represents a wild-type myo-1-phosphate synthase.

Novel isolated nucleic acid fragment encoding soybean myo-inositol 1-phosphate synthase, useful for altering raffinose saccharide, sucrose phytic acid and inorganic phosphate content of soybean seeds.

Claim 3; SEQ ID NO 2; 34pp; English

CC omplement, subfragment or the complement of the subfragment, operably CC linked to suitable regulatory sequences, where expression of the chimeric Gene results in a decrease in expression of an endogenous or native gene encoding a soybean myo-inositol 1-phosphate synthase), a soybean plant CC comprising the chimeric gene (with a heritable phenotype of a seed phytic caid content of less than 17 micromol/g, as seed content of raffinose plus CC greater than 200 micromol/g, micromol/g, and a seed sucrose content of greater than 200 micromol/g, provided that the plant is not LR33), seeds CC from the plant, making a soybean plant with the heritable phenotype (comprising crossing LR33 or the plant comprising the chimeric gene with an elite soybean plant and selecting a progeny plant of the cross of CC an elite soybean plant and selecting a progeny plant of the cross of CC mutant myo-inositol 1-phosphate synthase having decreased capacity for the synthesis of myo-inositol 1-phosphate synthase having decreased capacity for the synthesis of myo-inositol 1-phosphate, where the gene confers a copbean protein product derived from seeds of a soybean protein product derived from seeds of a soybean plant with the plant capacity for confering raffinose saccharide, sucrose, phytic acid and inorganic phosphate content of soybean seeds thus leading to valuable and useful conjugosaccharides in soy plants (and other legumes) can lead to flatulence oligosaccharides in soy plants (and other legumes) can lead to flatulence The invention relates to an isolated nucleic acid fragment encoding a soybean myo-inositol 1-phosphate synthase, or a mutant myo-inositol 1-phosphate synthase for myo-inositol 1-phosphate synthase having decreasing capacity for the synthase for myo-inositol-1-phosphate. Also included are a chimeric gene (comprising the

Example 5; Page 49-51; 63pp; English

CC This is the amino acid sequence of a mutant soybean myo-inositol 1-CC phosphate synthase (MI 1-PS) deduced from the coding region of an CC isolated cDNA clone (see AANG2443). MI 1-PS is involved in glucose CC metabolism to phytic acid, raffinose and stachyose. The MI 1-PS was CI identified in soybean line LR33, a mutagenised line of low raffinose CC saccharide phenotype. Sequencing revealed a single base change mutation CC in the LR33 gene sequence that resulted in a K396N substitution in the CC mutant protein compared to wild-type MI 1-PS (see AAW79740). The mutation CC results in a seed phenotype of very low raffinose saccharide sugars, very CC high sucrose and low phytic acid. The mutated nucleic acid is used to CC alter the raffinose saccharide, sucrose, phytic acid and inorganic CC phosphate content of soybean seeds, leading to useful soybean products, CC e.g. a seed phytic acid content of less than 17 ug/g, a seed content of CC raffinose and stachyose combined of less than 14.5 ug/g, and a seed CC sucrose content greater than 200 ug/g. (Updated on 17-OCT-2003 to CC standardise OS field)

The invention relates to a nucleic acid fragment encoding a soybean myo-
CC inositol 1-phosphate synthase or a mutant myo-inositol 1-phosphate
CC synthase having a decreased capacity for the synthesis of myo-inositol 1-
CC phosphate. The invention also relates to a chimeric gene operably linked
CC results in a decrease in expression of an endogenous or native gene
CC encoding a soybean myo-inositol 1-phosphate synthase, a sybean plant
CC comprising the chimeric gene, a method of making the soybean plant a
CC seed of the soybean seitol 1-phosphate synthase, a sybean plant
CC protessing of soybean seeds, a method of making the soybean plant a
CC seed of the soybean seeds, a method of making or producing a soy
CC protein product and a method of using a soybean plant homozygous for at
CC least one gene encoding a mutant myo-inositol 1-phosphate synthase having
CC decreased capacity for the synthesis of myo-inositol 1-phosphate. The
CC concessed capacity for the synthesis of myo-inositol 1-phosphate with
CC decreased raffinose, stachyose and phytic acid content and increased
CC sucrose and inorganic phosphate content, leading to valuable and useful
CC soybean products. This sequence represents a mutant soybean myo-inositol
CC 1-phosphate synthase polypeptide of the invention.
                                                                                                         Query Match

Novel isolated nucleic acid fragment encoding soybean myo-inositol 1-phosphate synthase, useful for altering raffinose saccharide, sucrose, phytic acid and inorganic phosphate content of soybean seeds. ij ĕ

The invention relates to an isolated nucleic acid fragment encoding a gybean myo-inositol 1-phosphate synthase, or a mutant myo-inositol 1-CC phosphate synthase having decreasing capacity for the synthase; its complement, subfragment or the complement of the subfragment or the complement of the subfragment, operably CC linked to suitable regulatory sequences, where expression of the chimeric gene comprising a soybean myo-inositol 1-phosphate synthase; its CC gene results in a decrease in expression of an endogenous or native gene encoding a soybean myo-inositol 1-phosphate synthase), a soybean plant CC greater than 200 micromol/g, as seed content of raffinose plus CC stachyose of less than 17 micromol/g, and a seed gucrose content of greater than 200 micromol/g, provided that the plant is not LR33), seeds CC from the plant, making a soybean plant with the heritable phenotype (comprising tree that has a heritable phenotype as mentioned above), seeds of a soybean plant and selecting a progeny plant of the cross of CC crossing step that has a heritable phenotype as mentioned above), seeds of soybean plant made by the above method, a soy protein product derived from seeds of a soybean plant (homozygous for one or more gene encoding a comprising step that has a heritable phenotype as mentioned above), seeds of a soybean protein product derived from seeds of a soybean plant with heritable phenotype as mentioned above), seeds of a soybean protein product derived from seeds of a soybean plant with heritable phenotype as mentioned above. The nucleic acid is useful for the synthase having decreased capacity for the synthase in soy plants (and other legumes) can lead to flatulence when consumed by humans. The present sequence represents a mutant myonosphate synthase. 1-phosphate synthase.

Sequence 510 8

New nucleic acid fragment encoding myo-inositol 1-phosphate synthase, useful for producing plants with decreased raffinose, stachyose, and phytic acid and increased sucrose, leading to valuable and useful soybean

Example 8; SEQ ID NO 14; 48pp; English

CC inositol 1-phosphate synthase or a mutant myo-inositol 1-phosphate CC synthase having a decreased capacity for the synthesis of myo-inositol 1-phosphate phosphate. The invention also relates to a chimeric gene operably linked CC to suitable regulatory sequences, where expression of the chimeric gene cresults in a decrease in expression of an endogenous or native gene conding a soybean myo-inositol 1-phosphate synthase, a soybean plant comprising the chimeric gene, a method of making the soybean plant, a corresponding a soybean plant, a soy protein product derived from the processing of soybean seeds, a method of making or producing a soy protein product and a method of using a soybean plant homozygous for at least one gene encoding a mutant myo-inositol 1-phosphate synthase having cereased capacity for the synthesis of myo-inositol 1-phosphate. The culteric acid fragment and methods are useful for producing plants with cereased raffinose, stachyose and phytic acid content and increased concents. This sequence represents a mutant soybean myo-inositol CC 1-phosphate synthase polypeptide of the invention. invention relates to a nucleic acid fragment encoding a soybean myo-

CC inositol 1-phosphate synthase or a mutant myo-inositol 1-phosphate
CC synthase having a decreased capacity for the synthesis of myo-inositol 1-
CC phosphate. The invention also relates to a chimeric gene operably linked
CC to suitable regulatory sequences, where expression of the chimeric gene
CC results in a decrease in expression of an endogenous or native gene
CC encoding a soybean myo-inositol 1-phosphate synthase, a soybean plant
CC comprising the chimeric gene, a method of making the soybean plant, a
CC seed of the soybean seeds, a method of making the soybean plant, a
CC processing of soybean seeds, a method of making or producing a soy
CC protein product and a method of using a soybean plant homozygous for at
CC least one gene encoding a mutant myo-inositol 1-phosphate synthase having
CC decreased capacity for the synthesis of myo-inositol 1-phosphate. The
CC decreased raffinose, stachyose and phytic acid content and increased
CC sucrose and inorganic phosphate content, leading to valuable and useful
CC soybean products. This sequence represents a wild type soybean myo-
inositol 1-phosphate synthase polypeptide of the invention.
Sequence 510 AA;

Novel isolated nucleic acid fragment encoding soybean myo-inositol 1-phosphate synthase, useful for altering raffinose saccharide, sucrose phytic acid and inorganic phosphate content of soybean seeds. sucrose,

Claim 3; SEQ ID NO 16; 34pp; English.

CC soybean myo-inositol 1-phosphate synthase, or a mutant myo-inositol 1-composition 1-phosphate synthase is for myo-composition 1-phosphate active and the synthase is for myo-composition 1-phosphate and encoding soybean myo-inositol 1-phosphate synthase, its complement, subfragment or the complement of the subfragment, operably complement, subfragment or the complement of the subfragment, operably complement of the subfragment of the chimeric gene results in a decrease in expression of an endogenous or native gene coding a soybean myo-inositol 1-phosphate synthase), a soybean plant comprising the chimeric gene (with a heritable phenotype of a seed phytic acid content of less than 17 micromol/g, as seed content of raffinose plus stachyose of less than 14.5 micromol/g, and a seed sucrose content of greater than 20 micromol/g, provided that the plant is not LR33), seeds comprising crossing LR33 or the plant with the heritable phenotype (comprising crossing LR3) or the plant with the heritable phenotype with a little soybean plant and selecting a progeny plant of the cross of crossing step that has a heritable phenotype as mentioned above), seeds cof soybean plant made by the above method, a soy protein product derived from seeds of a soybean plant (homozygous for one or more gene encoding a companiant of the crines of confers a for myo-inositol 1-phosphate synthase having decreased capacity for the synthasis of myo-inositol 1-phosphate synthase having decreased capacity for the synthasis of myo-inositol 1-phosphate synthase and series confers a second or more gene encoding a confers and series of the confers a second or more gene encoding a confers and series of the confers and ser the synthesis of myo-inositol 1-phosphate, where the gene confers a heritable phenotype as mentioned above), and making or producing a soybean protein product derived from seeds of a soybean plant with heritable phenotype as mentioned above. The nucleic acid is useful for altering raffinose saccharide, sucrose, phytic acid and inorganic phosphate content of soybean seeds thus leading to valuable and useful soybean products, since the presence of high concentration of raffinose cligosaccharides in soy plants (and other legumes) can lead to flatulence when consumed by humans. The present sequence represents a wild-type myo The invention relates to an isolated nucleic acid fragment encoding

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  results in a decrease in expression of an endogenous or native gene encoding a soybean myo-inositol 1-phosphate synthase, a soybean plant comprising the chimeric gene, a method of making the soybean plant, a seed of the soybean plant, a soy protein product derived from the processing of soybean seeds, a method of making or producing a soy protein product and a method of using a soybean plant homozygous for at least one gene encoding a mutann myo-inositol 1-phosphate synthase having decreased capacity for the synthesis of myo-inositol 1-phosphate. The nucleic acid fragment and methods are useful for producing plants with decreased raffinose, stachyose and phytic acid content and inorgenic phosphate content, leading to valuable and useful soybean products. This sequence represents a mutant soybean myo-inositol 1-phosphate synthase polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a nucleic acid fragment encoding a soybean myo-
inositol 1-phosphate synthase or a mutant myo-inositol 1-phosphate
synthase having a decreased capacity for the synthesis of myo-inositol 1-
phosphate. The invention also relates to a chimeric gene operably linked
to suitable regulatory sequences, where expression of the chimeric gene

                                                                                                                                                                                                                                                                                                                                                     ঠ
                                                                                                                                                                                                                                                                                                                                                                                                         B
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to an isolated nucleic acid fragment encoding a CC soybean myo-inositol 1-phosphate synthase, or a mutant myo-inositol 1-CC phosphate synthase having decreasing capacity for the synthesis for myo-inositol-1-phosphate. Also included are a chimeric gene (comprising the CC inositol-1-phosphate also included are a chimeric gene (comprising the CC complement, subfragment or the complement of the subfragment, operably CC linked to suitable regulatory sequences, where expression of the chimeric CC gene results in a decrease in expression of an endogenous or native gene encoding a soybean myo-inositol 1-phosphate synthase), a soybean plant CC comprising the chimeric gene (with a heritable phenotype of a seed phytic comprising the chimeric gene (with a heritable phenotype of a seed phytic CC stackyose of less than 17 micromol/g, as seed content of raffinose plus stackyose of less than 17 micromol/g, and a seed sucrose content of CC greater than 200 micromomol/g, provided that the plant is not LR33), seeds (comprising the plant comprising the chimeric gene with the neitable phenotype of an elite soybean plant and selecting a progeny plant of the cross of CC crossing step that has a heritable phenotype as mentioned above), seeds for soybean plant and selecting a progeny plant of the cross of cross-sof soybean plant and selecting a progeny plant of the cross of cross-sof myo-inositol 1-phosphate synthase having decreased capacity for the synthesis of myo-inositol 1-phosphate, where the gene confers a contains product derived from seeds of a soybean plant with the synthase having decreased capacity for contains a microsoft product derived from seeds of a soybean plant with the synthase phonotype as mentioned above), and making or producing a contain seeds in soybean seeds thus leading to valuable and useful conjusted the presence of high concentration of raffinose collipses when consumed by humans. The present sequence represents a mutant myo-inositol 1-phosphate synthase.
                                                                                                                                                                     ঠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                   ঠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match

           Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Score
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          seq length: 0 seq length: 2000000000

minor outer capsid protein - porcine rotavirus C (strain Cowden)

N,Alternate names: nonstructural protein NS26

C;Species: porcine rotavirus C

C;Date: 17-Feb-1994 #sequence_revision 17-Feb-1994 #text_change 09-Jul-2004

C;Accession: B48357

R;Bremont, M; Chabanne-Vautherot, D.; Cohen, J.

Arch. Virol. 130, 85-92, 1993

A;Title: Sequence analysis of three non structural proteins of a porcine group C (Cowden A;Reference number: A48357; MUID:93277387; PMID:8389118

A;Accession: B48357

A;Molecule type: genomic RNA

COFACTOR: NAD (By similarity).
COFACTOR: Inositol biosynthesis.
PATHWAY: Inositol biosynthesis.
SUBCELLULAR LOCATION: Cytoplasmic (By similarity).
SIMILARITY: Belongs to the myo-inositol-1-phosphate synthase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   TOBAC

COPACTOR: NAD (By similarity).
COPACTOR: Inositol biosynthesis.
PATHWAY: Inositol biosynthesis.
SUBCELLULAR LOCATION: Cytoplasmic (By similarity).
SIMILARITY: Belongs to the myo-inositol-1-phosphate synthase
                                                                                                                                                                                                                                                                                                                                                                                                                  family.

COPACTOR: NAD (By similarity).

CATHWAY: Inositol biosynthesis.

SUBCELLULAR LOCATION: Cytoplasmic (By similarity).

SIMILARITY: Belongs to the myo-inositol-1-phosphate synthase
                              SIMILARITY: Belongs family.

Patent No. 6791013

GENERAL INFORMATION:

APPLICANT: Armstrong, Katherine

APPLICANT: Hey, Timothy D

APPLICANT: Folkerts, Otto

APPLICANT: Hopkins, Nicole L

TITLE OF INVENTION: MAIZE MIP SYNTHASE PROW

FILE REFERENCE: 50597

CURRENT APPLICATION NUMBER: US/09/727,628

CURRENT APPLICATION NUMBER: US 60/168,612

PRIOR FILING DATE: 1999-12-02

PRIOR FILING DATE: 1999-12-02

NUMBER OF SEQ ID NOS: 3

SOFTMARF: DEFORT OF SEQ ID NOS: 3

Description

0

Pred. No. score grea

d. No. is the number of results predicted by chance to have a re greater than or equal to the score of the result being printed, is derived by analysis of the total score distribution.
